

GitHub Collaboration Guide for the MyAiCloud Project

Welcome to the team! This guide will walk you through the step-by-step process of how we will work together on the code using Git and GitHub. Following this workflow is essential to prevent conflicts and keep our project organized.

Step 1: Accept the Invitation & Clone the Project

First, you need to get a copy of the project on your computer.

1. **Accept the Invitation:** You will receive an email from GitHub inviting you to become a collaborator on the **MyAiCloud** repository. Click the link in the email to accept it.

Clone the Repository: Open your terminal or Git Bash and run the following command. This will download the entire project into a folder named **MyAiCloud** on your computer.

```
git clone https://github.com/VishallSingh-OS/MyAiCloud.git
```

2.

Step 2: Set Up Your Local Environment

Before you can start coding, you need to install all the necessary libraries for both the backend and frontend.

1. Backend Setup:

- Navigate into the **backend** folder: `cd MyAiCloud/backend`
- Create and activate your virtual environment: `python -m venv venv` and then `source venv/bin/activate` (or `.\venv\Scripts\Activate` on Windows).
- Install all Python libraries: `pip install -r requirements.txt`

2. Frontend Setup:

- Navigate into the **frontend** folder: `cd MyAiCloud/frontend`

- Install all JavaScript libraries: `npm install`

3. Create Your `.env` file:

- In the root `MyAICloud` folder, create a file named `.env` for your secret keys. Ask your team lead what variables need to be in it.

Step 3: The Daily Workflow (The Most Important Part)

This is the process you will follow **every time** you start working on a new task. **Never work directly on the `main` branch.**

1. Get the Latest Code (PULL)

Before you write a single line of code, make sure you have the most up-to-date version of the project.

```
git pull origin main
```

2. Create a New Branch for Your Task (BRANCH)

Create a separate, temporary branch for the feature you are working on. Give it a descriptive name.

```
# Example: If you are working on the user profile page
git checkout -b feature/user-profile-page
```

This command both creates the new branch and switches you to it.

3. Write Your Code

Now you can open the project in VS Code and work on your feature. Make all the changes you need.

4. Save Your Work (COMMIT)

Once you've made some progress, save a snapshot of your work with a clear message.

```
git add .
git commit -m "Add user profile picture and name display"
```

5. Upload Your Branch to GitHub (PUSH)

Send your new branch up to the central GitHub repository.

```
git push origin feature/user-profile-page
```

Step 4: Create a Pull Request (PR)

A Pull Request is how you ask for your new feature to be added to the main project.

1. Go to the project's page on GitHub.com.
2. You will see a green button that says "Compare & pull request" for the branch you just pushed. Click it.
3. Give your Pull Request a clear title and a brief description of the changes you made.
4. Click "Create pull request".

Your team lead will now be notified. They will review your code, and if everything is okay, they will **merge** it into the **main** branch.

Step 5: After Your PR is Merged

Once your work has been added to the main project, you should clean up your local workspace.

Switch back to the main branch:

```
git checkout main
```

1.

Get the latest version (which now includes your merged changes):

```
git pull origin main
```

2.

Delete your old feature branch:

```
git branch -d feature/user-profile-page
```

3.

You are now ready to start the cycle again for your next task!
